

PledgeGuard

One collateral. One live claim.

Stops double-pledged collateral before any money moves, without exposing a single lender's book.

Live on Canton DevNet

2-of-3 decentralized registry

HackCanton Season 3 · RWA & Business Workflows · pledgeguard.fyra.fun

The product, live: a second lender's draw on already pledged collateral, stopped with nothing paid out.

Double-pledged collateral has cost lenders billions

\$170M

Tricolor

JPMorgan's charge-off after the same auto loans were pledged to several banks (2025)

~\$10B

First Brands

Liabilities at bankruptcy, with receivables financed more than once (2025)

£930M

MFS (UK)

Market Financial Solutions: shortfall facing its lenders over alleged double pledging (2026)

Each lender's diligence was correct on its own book, and blind to the others.

Sources: JPMorgan Q3 2025 disclosure; First Brands Chapter 11 filings; Bloomberg, 27 Feb 2026.

Hidden on private books, exposed on public chains

Today: private books

Each lender sees only its own loans. A second pledge of the same file is invisible to it.

A public chain

The double pledge would show, and so would every rival's borrowers, amounts and rates.

Canton with PledgeGuard

The collision is detected while every book stays private, in the same transaction.

The product only exists if detection and confidentiality happen together.

Why now: fresh losses, money moving on-chain

Double pledging is on every credit committee's agenda

- Tricolor: SEC charges against former executives, Aug 2026
- First Brands: founders indicted, Jan 2026
- Market Financial Solutions: administration, Feb 2026

Collateral and settlement are moving onto Canton

- DTCC Tokenization Service: commercial launch scheduled Oct 2026
- Broadridge DLR runs repo on Canton every day
- USD1 issued natively on Canton since Aug 2026

For the first time, the check and the money can live in the same transaction.

How PledgeGuard stops a double pledge

No lender learns who the other lender is. The registry sees fingerprints, never loan terms.

Live on Canton DevNet, with real Canton Coin

The screenshot displays the PledgeGuard web application interface. On the left, a sidebar contains navigation links: 'First lender' (with a sub-link 'Finances the borrower against the collateral'), 'PLATFORM' (with sub-links 'Workspace', 'Visibility', and 'Governance'), and 'NETWORK' (with sub-links 'Canton DevNet', 'LEDGER OFFSET', and '2181578'). The main content area is titled 'COLLATERAL COLLISION REGISTRY ON CANTON'. It features a 'Maturity' input field set to '01/04/2027' with a 'Send proposal' button. Below this is a table with columns: AMOUNT, RATE, MATURITY, FINGERPRINT, and DRAW (CC). The table contains one row with values: 1,000,000, 8.5%, 2027-04-01, b8dcf1c73b...49f7, and 5. A 'Draw' button is next to the 'DRAW (CC)' value. To the right of the table are three summary cards: 'LIVE PLEDGES' (1), 'DRAWS UNDER CHECK' (0), and 'FUNDS RESERVED FOR A DRAW' (0). At the bottom, a 'PROPOSALS SENT' section shows a message: 'Draw of 5 CC submitted to the registry check' with a ledger update hash and offset.

AMOUNT	RATE	MATURITY	FINGERPRINT	DRAW (CC)
1,000,000	8.5%	2027-04-01	b8dcf1c73b...49f7	5

50 → 45 CC

The first lender draws 5 Canton Coin: settled, pledge recorded

4 CC

The second lender's draw on the same collateral: reserved, never paid out, released back

5 roles

Borrower, two lenders, registry operator, auditor: one workspace each

pledgeguard.fyra.fun/app · read-only Explore for anyone, a jury access code for the judges

A large market, priced per draw

WHO BUYS

Warehouse & ABL desks

Receivables finance & factoring

Private credit funds

First on Canton: Alpend, Cenote, ACME Markets.

THE MONEY THAT MOVES, EVERY YEAR

€4.0T

factored worldwide in 2025 (FCI)

\$1.7T

in private credit, moving to asset-based finance (Preqin)

BOTTOM-UP, PER LENDER

\$2B

drawn per year by a
mid-size lender

× 1 bp

fee per draw

= \$200k

revenue per lender per
year

50 lenders = **\$10M** a year

Illustrative assumptions, to validate with the first pilots.

The lender pays per draw, inside the settlement

Per-draw fee

A few basis points of each draw, taken inside the same settlement transaction: no invoice, no collection.

Annual membership

Paid by participating lenders for access to the registry and its tooling.

Members share fees

A share of the fees for hosting the decentralized party: BitSafe, NODERS and PledgeGuard.

Why the lender pays: it is the party that avoids the loss, and it already pays for diligence that cannot see other lenders.

What we have proven

24

transactions in the
Daml test suite, every
privacy assertion green

3

bypass found by our
own review and fixed:
re-registering a pledged
file

Every number on screen in the video and on the platform carries its ledger update id and offset.

Not another lookup: a check enforced at settlement

	Borrower reps & UCC searches	Central registry (MonetaGo-style)	Public chain	PledgeGuard
Sees across lenders	✗	✓	✓	✓
Keeps every lender's book private	✓	✗	✗	✓
Stops the funding itself	✗	advises before funding	only if built in	✓
No single operator to trust	n/a	✗	✓	✓

MonetaGo's duplicate-financing registry is live on Swift, which proves the demand. It sees everyone's documents and advises; PledgeGuard sees only fingerprints and enforces.

Go-to-market: Canton first, then secured finance

1. Canton-native lenders

Alpend, Cenote and ACME Markets already hold parties, wallets and stablecoin rails: integration is a Daml package and a few API calls.

2. Canton Foundation RFP 12.2

A grant track for repo, collateral, lending and servicing workflows, with institutional introductions.

3. BitSafe and node operators

BitSafe's Decentralization Manager ecosystem and NODERS bring the registry's independent members.

4. Secured-finance associations

SFNet and the LSTA reach the ABL, factoring and loan-operations teams beyond Canton.

Team

Nolwen Sean HONONTA

Founder, solo builder

BUILT DURING THE HACKATHON

- Daml model and a 24-transaction test suite
- Registry automation and its security fixes
- The live platform, deployed and hardened
- The decentralized registry on a 3-node Canton network

NEXT HIRES

A credit / ABL lead

To run lender pilots and the fingerprint schema

A Canton engineer

To operate the registry members and integrations

What we are asking for

Grand Final and the AppsFactory accelerator

8 weeks to turn the live platform into a pilot-ready product

A Canton Foundation grant (RFP 12.2)

To fund the registry members, the fingerprint schema and conformance tests

One pilot lender and two registry members

A 90-day shadow pilot on real facilities, no funds; BitSafe and NODERS as members

WHAT IT BUYS IN 90 DAYS

WEEKS 1 TO 4

Three independent registry members on DevNet; fingerprint schema v1

WEEKS 5 TO 8

Shadow pilot: 20 real fingerprints, one collision drill

WEEKS 9 TO 12

First settled stablecoin draw on TestNet; Featured App application

One collateral.

One live claim.

LEDGER OFFSET

-

COLLATERAL COLLISION REGISTRY ON CANTON

Guide

Who sees what

Active contracts held by each organisation, counted from the ledger's answer to that organisation alone. A dot means the ledger never sent it a single contract of that kind. No amount, rate or name appears on this page.

CONTRACT	BORROWER	FIRST LENDER	SECOND LENDER	REGISTRY OPERATOR	AUDITOR
CollateralFingerprint	.	.	.	.	.
FacilityProposal	.	.	.	.	.
Facility	2	1	1	.	.
DrawRequest	.	.	.	.	.
Allocation	.	.	.	.	.
ClaimIndex	.	1	.	1	.
Claim	.	1	.	1	.
CollisionNotice	.	1	1	2	2
RegistryDelegation	.	.	.	1	.

The row to read is Facility: the borrower and each lender hold their own, the registry operator and the auditor hold none.

Who sees what, counted from each organisation's own ledger view.

Each organisation sees only its own contracts

Contract	Borrower	First lender	Second lender	Registry operator	Auditor
Collateral fingerprint	yes	never	never	yes	never
Facility (amount, rate, maturity)	both	its own	its own	never	never
Live pledge	never	its own	its own	yes	never
Double-pledge alert	never	its own	its own	yes	yes

Not a screen filter: each column is what that organisation's own ledger view returns. The registry operator and the auditor never receive a single loan.

Why this only works on Canton

Sub-transaction privacy

Each lender gets its own view of the ledger: the other lender's facility never even exists for it.

A registry blind to loans

A neutral registry party signs the collision check without being a party to any facility.

Atomic check and payment

The check and the Canton token-standard transfer are atomic: a colliding draw simply does not fund. No race.

No single operator

The registry runs as a Canton decentralized party: anything sensitive needs two of three members.

A registry no single institution controls

AUTOMATIC, EVERY DAY

Record a new collateral fingerprint
Check a draw and release the funds

NEEDS TWO MEMBERS OUT OF THREE

Switch the automatic checks on or off
Free a collateral under dispute

ONE APPROVAL IS NOT ENOUGH

"The requirement 'Enough confirmations to execute action' was not met."

Proven on a three-node Canton network with BitSafe's Decentralization Manager. On DevNet the registry runs as a single party with the same automation.
